

Debugging and Profiling

10 questions

1
point

1.

Debugging is the process of

- ☐ writing code that uses memory efficiently
 - ☒ getting your expectations about code behavior to converge with reality
 - ☐ writing code that is as fast as possible
 - ☐ handling errors in a nonstandard manner
-

1
point

2.

Which of the following functions initiates an interactive debugging environment that allows you to step through code one expression at a time?

- ☐ try()
 - ☐ tryCatch()
 - ☐ stop()
 - ☒ browser()
-

1
point

3.

Which of the following functions allows you to temporarily insert pieces of code into other functions to modify their behavior?

- ☒ trace()
 - ☐ debug()
 - ☐ browser()
 - ☐ recover()
-

1
point

4.

What does the traceback() function do?

- ☐ pauses execution of a function
 - ☐ evaluates an expression and returns an object of "try-error" if an error occurs
 - ☐ sets the debugging flag for a function
 - ☒ returns the state of the function call stack just before an occurred
-

1
point

5.

When should the traceback() function be called?

- ☐ only while debugging inside a function
 - ☒ immediately after an error occurs
 - ☐ immediately after a warning occurs.
 - ☐ any time after an error occurs
-

1
point

6.

What does calling `trace("f")` for function "f" do?

- ☐ Whenever f() is called, the function call stack is written to a file.
 - ☒ Whenever f() is called, a message is printed to the console indicating that the function was called.
 - ☐ It generates a log file containing debugging information.
 - ☐ Whenever f() is called, it will enter the interactive debugger.
-

point

7.

What is the `microbenchmark` package useful for?

- ☒ comparing the speed of several functions that do the same thing
 - ☐ modifying code in other developers' packages
 - ☐ handling warnings and errors in non-standard ways
 - ☐ interactively debugging functions
-

1
point

8.

What does the `RProf()` function do?

- ☐ re-formats your code to adhere to standards
- ☐ analyzes your code for potential bugs
- ☒ writes out the function call stack at user-specified intervals of time
- ☐ visualizes the time behavior of R code

1
point

9.

What does the `profvis()` function do?

- ☐ prints debugging information to the console
 - ☐ visualizes code that runs quickly (in less than 10 milliseconds)
 - ☒ displays profiling information in an interactive visualization in RStudio
 - ☐ writes a log file of the function call stack
-

1
point

10.

Which function is better for analyzing fast-running functions: `profvis()` or `microbenchmark()`?

- ☐ `microbenchmark()`
 - ☒ `profvis()`
-
